## ALIGNMENTS

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRs, AAY90643-AAY90677 and AAY90683-Y90687), and to DNA encoding them (AAA30709-A30743 and AAA30775-A30779). The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (ICS) and transmembrane domain 6 (TMG). A non-endogenous maino acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous proline in TM6 to form a sequence X-AAA15-Pro. The endogenous amino acid is selected from Ly9, His, Arg or AAA15-Pro. The endogenous amino acid is selected from Ly9, His, Arg or Ala, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. The 15 G protein-coupled receptor; GPCR; constitutively active; intracellular loop 3; transmembrane domain 6; drug screening; agonist; Non-endogenous constitutively activated human G protein-coupled receptors, useful for identifying agonists for use as pharmaceutical Example 1; Page 308-309; 341pp; English. Database

amino acid stretch between the substituted amino acid and the Pro may be endogenous, non-endogenous, or a mixture of endogenous and non-endogenous residues. The constitutively active GPCRs are useful for identifying antagonists, agonists and partial agonists for use as pharmaceutical agents. The mutant proteins are also useful in research settings for elucidating the roles of the receptors in normal and diseased conditions. Antagonists for a particular GPCR are useful for treating diseases and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous ligands. The present sequence represents a human wild-type GPCR referred to in an exemplification of the invention 8 $\pm$ 8

```
the compound is a GPR40 receptor (G protein-coupled receptor) ligand comprises detecting whether the test compound competitively inhibits the binding of a farty acid GPR40 ligand to a GPR40 erceptor. Also included comprises detecting whether the test compound competitively inhibits the binding of a farty acid GPR40 ligand to a GPR40 erceptor. Also included comprising: (a) measuring any detectable signal produced by a reporter gene (comprising: (a) measuring any detectable signal produced by a reporter comprising a reporter gene under the control of G protein Gq cresponsive transcriptional element); (b) detecting a decrease in reporter gene expression in the presence of both test compound and agonist, or (c) detecting whether the compound decreases glucose-stimulated insulin release from mammalian pancreatic beta cells in the presence of a GPR40 agonist, compared to glucose-stimulated insulin release that would occur cdue to the presence of the GPR40 agonist (2) a method of screening any compound for GPR40 agonist activity, which comprises: (a) detecting any compound for GPR40 agonist activity, which comprises: (a) detecting any compound for GPR40 agonist activity, which comprises: (b) detecting whether the compound binds to GPR40 and increases glucose-stimulated insulin release from mammalian cantagonist or agonist compounds for treating disorders e.g. type 2 antagonist or agonist compounds for treating disorders e.g. type 2 disabase (e.g. Alzheimer's disease) or stroke. The present sequence represents human GPR40

New isolated antigenic peptides e.g., for G protein-coupled receptors (GPCR), useful for diagnosing and designing drugs for treating conditions in which GPCRs are involved, e.g. AIDS, Alzheimer's disease, cancer or autoimmune diseases.

Disclosure, Fig 1; 523pp; English.

The present invention describes antigenic peptides (I) comprising: (a) any one of 1601 sequences (see ABP82019 to ABP83619) of 12-24 amino caids. Also described: (1) an assay for the detection of a particular G protein-coupled receptor (GPCR) or a candidate polyapptide in a sample; and (2) an isolated antibody having high specificity and high affinity or cardidate polyapptide in a sample; and (2) an isolated antibody having high specificity and high affinity or antibody against a particular GPCR. (I) can be used as GPCR modulators and in gene therapy. The antigenic peptides for GPCRs are useful in detecting an antibodies. The peptides and antibodies are also useful for detecting the presence or absence of corresponding GPCRs. The antigenic peptides for GPCRs and antibodies are useful for diagnosing and designing drugs for captaing immune-related diseases, growth-related diseases, cell regeneration-related diseases, immunological-related cell proliferative diseases, or autoimmune diseases, e.g. AIDS, Alzhaimer's disease, atherosclerosis, bacterial, fungal, protozoan or viral infections, osteoporosis, cancer, cardiomyopathy, chronic and acute inflammation, allergies, Crohn's disease, disease, variation, sectoporosis, cancer, cardiomyopathy, chronic and acute disease, parkinson's disease, multiple sclerosis, pain, psoriasis, canxety, depression, schizophrenia, dementia, memory conservation, renal disorders, rheumatoid arthritis, trauma, ulcers, or hypotension, renal disorders, rheumatoid arthritis, trauma, ulcers, or way the present invention inmunoassays and immunodiagnosis. Abs21523 to ABS21869 encode GPCR proteins given in ABPB1675 to ABBP2018, which are used in the

Sequence 300 AA;

WPI; 2003-671661/63. N-PSDB; ADB61403. Fatty acid and eicosanoid-binding G-protein coupled receptor protein GPR40 for control of pancreatic function and treatment of diabetes.

Claim 34; Page 235-236; 257pp; Japanese.

and eicosanoid-binding G-protein complete receptor protein, GPR40,

coriginating in mouse, rat, crab-earing machey and hamater (sequences

fully defined in the specification), equivalent proteins of smilar

activity, and peptides containing partial sequences of the GPR40 protein.

The novel fatty acid and GPR40 protein and their compositions have the

following activities: antidiabetic, anabolic, neuroprotective,

nephrotropic, ophthalmological, antilipaemic, dermatological,

notropic, ancectic, hypotensive, and cytostatic. The novel fatty acid

and eicosanoid-binding G-protein coupled receptor protein, GPR40, and

curther compositions can be used in the treatment, prevention and

diagnosis of diabetes, ketosis, diabetic neuropathy, diabetic

curther compositions are not in acidosis, diabetic neuropathy, diabetic

arthritis, bone diseases, arteriosolerosis, thrombosis, hypertension,

indigestion, memory loss, obesity, hyporlipaemia, skin diseases,

indigestion, memory loss, obesity, hyposilycaemia, edema, innulin

resistance, insulin allergy, fat metabolism disorders and cancer. This

sequence represents a human GPR40 protein of the invention. The invention relates to a novel screening method comprising a fatty acid

```

The method is useful for creating a constitutively active
                                                                                                                                          9
                                                                                                                                                                                    9

ö
version of an endogenous human GPCR that comprises a transmembrane 6 region and an intracellular loop 3 region. The altered human GPCR polypeptides are useful for screening test compounds for identification of inverse agonists or partial agonists of GPCR polypeptides, which may have therapeutic uses. The altered GPCRs may also be used in vivo or in vitro in biological research. A nucleic acid encoding the altered GPCR may be used to create a transgenic animal expressing the altered GPCR. The method allows screening for compounds that modulate the activity of a human G protein-coupled receptor without the need for provision of a ligand for the receptor. This is particularly useful in allowing screening of compounds against orphan receptors for which no ligand is currently known. This sequence represents a human GPCR polypeptide of the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           180
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      240

AAY90677 and AAY90683-Y90687), and to DNA encoding them (AAA30709-A30743) and tanamembrane domain 6 (TW6). A non-endogenous amino acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino acid N-terminal of an endogenous proline in TW6 to form a sequence X-caids N-terminal of an endogenous proline in TW6 to form a sequence X-da, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. The 15 amino acid stretch between the substituted amino acid and the Pro may be endogenous, non-endogenous, or a mixture of endogenous and non-endogenous can endogenous and non-endogenous can anixture of endogenous and non-endogenous candomists are also useful for treating for anixtogenists are also useful for treating diseased and disorders associated with that receptors in normal and diseased conditions. Anixagonists for a particular GPCR are useful for treating diseases and disorders associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous ligands. Sequences AAY90643-
                                                                                                                                                                                                         constitutively active, non-endogenous versions
Non-endogenous constitutively activated human G protein-coupled receptors, useful for identifying agonists for use as pharmaceutical
                                                                                                                                     Example 2; Page 325-326; 341pp; English.
                                                                                                                                                                                                      The invention relates to

The invention relates to a method for treating a non-endogenous, constitutively active version of an endogenous human G protein-coupled receptor (GPCR) that has a transmembrane-6 (TMG) region and an intracellular-3 (IC3) region, by substituting a specific amino acid in intracellular-3 (IC3) region, by substituting a specific amino acid in the TMG region with a different amino acid, and testing for constitutive activity. The method is useful for creating a constitutively active version of an endogenous human GPCR that comprises a transmembrane 6 region and an intracellular loop 3 region. The altered human GPCR copypeptides are useful for screening test compounds for identification of inverse agonists or partial agonists of GPCR polypeptides, which may have therapeutic uses. The altered GPCRs may also be used in vivo or in vitro in biological research. A nucleic acid encoding the altered GPCR may be used to create a transgenic animal expressing the altered GPCR conting of compounds for compounds that modulate the activity of a ligand for the receptor. This is particularly useful in allowing currently known. This sequence represents a human GPCR polypeptide of the

Fatty acid and eicosanoid-binding G-protein coupled receptor protein GPR40 for control of pancreatic function and treatment of diabetes.

Claim 1; Page 240-241; 257pp; Japanese.

The invention relates to a novel screening method comprising a fatty acid and eicosanoid-binding G-protein coupled receptor protein, GPR40, and eicosanoid-binding G-protein coupled receptor protein, GPR40, coriginating in mouse, rat, crab-eating monkey and hamater (sequences fully defined in the specification), equivalent proteins of similar activity, and peptides containing partial sequences of the GPR40 protein. The novel fatty acid and GPR40 protein and thehair compositions have the following activities: antidiabetic, anabolic, neuroprotective, nephrotropic, ophthalmological, antilipaemic, dermatological, antiarterisoclarotic, antiarthritic, osteopathic, thrombolytic, nootropic, anorectic, hypotensive, and cytostatic. The novel fatty acid and eicosanoid-binding G-protein coupled receptor protein, GPR40, and clarence compositions can be used in the treatment, prevention and diagnosis of diabetic retinopathy, hyperlipaemia, skin diaesses, capturitis, bone diseases, arteriosclerosis, thrombosis, hypertension, indigestion, memory loss, obesity, hyposlycaemia, edema, insulin allergy, fat metabolism disorders and cancer. This sequence represents a monkey GPR40 protein of the invention.

Identifying GPR40 receptor ligand for treating disorders e.g. obesity, comprises detecting whether the test compound competitively inhibits the binding of a fatty acid GPR40 ligand to a GPR40 receptor.

Disclosure, Page 51; 53pp; English.

The invention relates to screening a test compound to determine whether the compound is a GPR40 receptor (G protein-coupled receptor) ligand comprises detecting whether the test compound competitively inhibits the binding of a farty acid GPR40 ligand to a GPR40 receptor. Also included comprising: (a) measuring any detectable signal produced by a reporter comprising; (a) measuring any detectable signal produced by a reporter gene (comprising) a reporter gene under the control of G protein Gq responsive transcriptional element); (b) detecting a decrease in reporter gene expression in the presence of both test compound and agonist; or (c) detecting whether the compound and agonist; or (c) detecting whether the compound and agonist; or (c) detecting whether the GPR40 agonist; (2) a method of screening a compound for GPR40 agonist; (2) a method of screening a compound for GPR40 agonist; (2) a method of screening a compound for GPR40 agonist activity, which comprises: (a) detecting any reporter gene expression; or (b) detecting whether the compound binds to GPR40 and increases glucose-stimulated insulin release from mammalian pancreatic beta cells. The method is useful for identifying GPR40 antagonist or agonist compounds for treating disorders e.g. type 2

The invention relates to a novel screening method comprising a fatty acid and eicosanoid-binding G-protein coupled receptor protein, GPR40, originating in mouse, rat, crab-eating monkey and hamster (sequences tully defined in the specification), equivalent proteins of similar activity, and peptides containing partial sequences of the GPR40 protein. The novel fatty acid and GPR40 protein and their compositions have the following activities: antidiabetic, anabolic, neuroprotective, nephrotropic, ophthalmological, antilipaemic, dermatological, antiarterioscherotic, antiarthritic, osteopathic, thrombolytic, nootropic, anorectic, hypotensive, and cytostatic. The novel fatty acid and eicosanoid-binding G-protein coupled receptor protein, GPR40, and diagnosis of diabetes, ketosis, acidosis, diabetic neuropathy, diabetic retinopathy, hyporlipaemia, skin diseases, arthritis, bone diseases, arteriosclerosis, thrombosis, hypertension, indigestion, memory loss, obesity, hypoglycaemia, edema, insulin cresistance, insulin allergy, fat metabolism disorders and cancer. This sequence represents a mouse GPR40 protein of the invention.

The invention relates to a novel screening method comprising a fatty acid and elcosanoid-binding G-protein coupled receptor protein, GPR40, originating in mouse, rat, crab-eating monkey and hamster (sequences cully defined in the specification), equivalent proteins of similar activity, and peptides containing partial sequences of the GPR40 protein. The novel fatty acid and GPR40 protein and theat compositions have the collowing activities: antidiabetic, anabolic, neuroprotective, nephrotropic, ophthalmological, antidiabetic, anabolic, neuroprotective, nephrotropic, antiatrhitic; osteopathic, thrombolytic, notropic, antiatrhitic, osteopathic, thrombolytic, and elcosanoid-binding G-protein coupled receptor protein, GPR40, and elcosanoid-binding G-protein coupled receptor protein, GPR40, and functions can be used in the treatment, prevention and funganosis of diabetes, ketosis, acidosis, diabetic neuropathy, diabetic retinopathy, hyperlipaemia, skin diseases, arthitis, bone diseases, arteriosclerosis, thrombosis, hypertension, arthitis, bone diseases, arteriosclerosis, thrombosis, hypertension, resistance, insulin allersy, fat metabolism disorders and cancer. This sequence represents a rat GPR40 protein of the invention.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 LKAVEALASGAWPLPASLCPVFAVAHFFPLYAGGGFLAALSAGRYLGAAFPLGYQAFRRP 120

The invention relates to a novel screening method comprising a fatty acid and elcosanoid-binding G-protein coupled receptor protein, GPR40, coriginating in mouse, rat, crab-eating monkey and hamster (sequences tully defined in the specification), equivalent proteins of similar activity, and peptides containing partial sequences of the GPR40 protein. The novel fatty acid and GPR40 protein and their compositions have the following activities: antidiabetic, anabolic, neuroprotective, comprortoric, ophthalmological, antilipaemic, dermatological, antiarterisoslerotic, antiarthritic, ossteopathic, thrombolytic, concropic, anorectic, hypotensive, and cytostatic. The novel fatty acid and elcosanoid-binding G-protein coupled receptor protein, GPR40, and curropic, and elcosanoid-binding G-protein coupled receptor protein, GPR40, and clasmosis of diabetes, ketosis, acidosis, diabetic neuropathy, diabetic nephropathy, diabetic retinopathy, hyperlipaemia, skin diseases, conputatis, bone diseases, arteriosclerosis, thrombosis, hypertension, indigestion, memory loss, obesity, hypoglycaemia, edema, insulin allergy, fat metabolism disorders and cancer. This creatstance, insulin allergy, fat metabolism disorders and cancer. This
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           61 LKAVEALASGAMPLPASLCPVFAVAHFFPLYAGGGFLAALSAGRYLGAAFPLGYQAFRRP 120

```

The present sequence is that of human G-protein coupled receptor 42 (GPR 42). The invention is based on the finding that expression of GPR 42 and

```
æ
GPR 41 (see AAB82758) is restricted to adipose tissue. GPR 41 or GPR 42 may therefore be used as a screening target for the identification and development of novel pharmaceutical agents for use in inhibiting lipplysis. Methods are claimed for identifying agents that modulate GPR 41 or GPR 42 activity, involving: (1) contacting a test agent with GPR 41 or GPR 42 or a variant polypeptide capable of coupling to a G-protein; and (2) monitoring for GPR 41 or GPR 42 activity in the presence of a G-protein, thereby determining whether the test agent modulates activity. Such agents, which may be an activator of GPR 41 or GPR 42, an inhibitor of lipolysis, or a polynucleotide encoding GPR 41, GPR 42 or variant polypeptide, are useful for the treatment of dyalipidaemia, coronary heart disease, atherosclerosis, thrombosis or obesity, angina, chronic metabolic syndrome (syndrome X) (all claimed)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                  61 DLLLLLEIPPRAVEAANGMHWPLPFILCPLSGFIPFTTIYLTALFLAAVSIERFLSVAHP 120

The invention relates to constitutively active, non-endogenous versions of endogenous human orphan G protein-coupled receptors (GPCRs, AAY90643-AAY90677 and AAY906677 and AAY90677). The mutant proteins of the invention contain a mutation in a portion of the protein comprising intracellular loop 3 (IC3) and transmembrane domain 6 (TM6). A non-endogenous amino acid, X, is substituted for an endogenous residue in IC3 at a position 16 amino acids N-terminal of an endogenous proline in IM6 to form a sequence X-C (AA)15-Pro. The endogenous proline in IM6 to form a sequence X-Ala, and is preferably Lys. When the endogenous residue at this position is Lys, this residue is replaced by His, Arg or preferably Ala. The 15 amino acid stretch between the substituted amino acid and the Pro may be endogenous, non-endogenous, or a mixture of endogenous and non-endogenous candonists, agonists and partial agonists for use as pharmaceutical agenists. The mutant proteins are also useful in research settings for antagonists for a particular GPCRs are useful for treating diseases and disadrers associated with that receptors in normal and diseases and disadrers associated with that receptor. Because the novel mutant GPCRs are constitutively active, they can be used directly for screening of compounds without the need for endogenous Ingands. The present sequence the new and particular GPCR referred to in an exemplification of
Non-endogenous constitutively activated human G protein-coupled receptors, useful for identifying agonists for use as pharmaceutical
                                                                                                                 Example 1; Page 310-311; 341pp; English.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                 the invention

The present sequence is that of human G-protein coupled receptor 41 (GPR 41). The invention is based on the finding that expression of GPR 41 and C GPR 42 (see ABB82759) is restricted to adipose tissue. GPR 41 or GPR 42 may therefore be used as a screening target for the identification and development of novel pharmaceutical agents for use in inhibiting and the comparis. Methods are claimed for identifying agents that modulate GPR 11polysis. Methods are claimed for identifying agents that modulate GPR 41 or GPR 42 or a variant polypeptide capable of coupling to a G-protein, and (2) monitoring for GPR 41 or GPR 42 activity in the presence of a G-protein, thereby determining whether the test agent modulates activity. Such agents, which may be an activator of GPR 41, GPR 42, an inhibitor of lipolysis, or a polynucleotide encoding GPR 41, GPR 42 or variant polypeptide, are useful for the treatment of dyslipidaemia, coronary heart disease, atherosclerosis, thrombosis or obesity, angina, chronic renal failure, peripheral vascular disease, stroke, type II diabetes or metabolic syndrome (syndrome X) (all claimed)

INFORMATION:
Patent No. 655539
GENERAL INFORMATION:
APPLICANT: Behan, Dominic P.
APPLICANT: Behan, Deek T.
APPLICANT: Liaw, Chen W.
ITILE OF INVENTION: No. 655339-Endogenous, Constitutively Activated Human G Protein-III REFERENCE: AREN-0040
ITILE OF INVENTION: NUMBER: US/09/170,496D
CURRENT APPLICATION NUMBER: US/09/170,496D
CURRENT FILING DATE: 1998-10-13
SOFTWARE: Patentin version 3.1
SEQID NOS: 294
SEQID NOS: 294
SEQID NOS: 294
          APPLICANT: Behan, Dominic P.
APPLICANT: Chalmers, Derek T.

Sequence 276, Application US/09170496D

Patent No. 655339

GENERAL INFORMATION:

APPLICANT: Behan, Dominic P.

APPLICANT: Chalmers, Derek T.

APPLICANT: Liaw, Chen W.

TITLE OF INVENTION: No. 655339-Endogenous, Constitutively Activated Human G Protein-C TITLE OF INVENTION: No. 655339-Endogenous, Constitutively Activated Human G Protein-C TITLE OF INVENTION: No. 655339-Endogenous, Constitutively Activated Human G Protein-C TITLE OF INVENTION: NO. 655339-Endogenous, Constitutively Activated Human G Protein-C CURRENT FILING DATE: 1998-10-13

NUMBER OF SEQ ID NOS: 294

SEQ ID NO 276

LENGTH: 330
